### 5 V Low Drop Voltage

Low-Dropout 5V, 12V Regulator Circuits using Transistors. The transistorized low-dropout voltage regulator circuit ideas explained in the following article can be used for getting stabilized output voltages right from 3 V and above, such as 5 V, 8 V, 9 V, 12 V, etc with an extremely low dropout of 0.1 V. For example, if you make the proposed 5 V LDO circuit, it will continue to produce an output of a constant 5 V even if the input supply is as low as 5.1 V.

Let's do one more example. Say if you have the same circuit above with 5V but only want 1V. If we use a 10K $\Omega$  as our R1 resistor, plugging in the values, we get R2= (V)/(R1)/(VIN - V)= (1V)/(10K $\Omega$ )/(5V - 1V)= 2.5K $\Omega$ . So we can use a 2.5K $\Omega$  resistor as our R2 resistor with the R1 resistor being 10K $\Omega$ . So it's easy to see now how any voltage can be obtained with a resistor voltage divider circuit.

### How to Reduce Voltage with Resistors

The voltage drop V in volts (V) is equal to the wire current I in amps (A) times 2 times one way wire length L in feet (ft) times the wire resistance per 1000 feet R in ohms (Q/ft) divided by 1000: V drop (V) = I wire (A)  $\times$  R wire (Q)
