Fossil and modern gastropod shells can yield information about their chronological age at death through the methods of sclerochronology. This technique uses the temperature-dependence of the ratio between two stable (i.e., non-radioactive) isotopes of oxygen when it is incorporated into the calcium carbonate (CaCO_3) of the gastropod shell.

A fossil (from Classical Latin: fossilis, literally 'obtained by digging') is any preserved remains, impression, or trace of any once-living thing from a past geological age. Examples include bones, shells, exoskeletons, stone imprints of animals or microbes, objects preserved in amber, hair, petrified wood, oil, coal, and DNA remnants. The totality of fossils is known as the fossil record.

Turtles are the reptile order Testudines. They have a special bony or cartilaginous shell developed from their ribs that acts as a shield.. The order Testudines includes both living and extinct species. The earliest fossil turtle comes from the early Upper Triassic of China, about 220 million years ago. So turtles are one of the oldest surviving reptile groups and a more ancient group than ...

Consider one ghostscape. 9 In Richard Misrach's photograph, where spectral trees tilt out of a pallid swamp, the water is an eerie green cut across by the blood-rust artery of an oil pipeline. At first glance, the image is ethereal, almost beautiful: that silky water, that pale green. But a visual disturbance, a phantom, mars the scene, troubling the eye.

Titanium is a low density, strong, lustrous, corrosion-resistant (including sea water, aqua regia and chlorine) metal with a silver color. It was discovered in Great Britain by William Gregor in 1791, and named by Martin Heinrich Klaproth for the Titans of Greek mythology. William Henry uses only aerospace-grade titanium alloy for our frames, clips, and micro-fasteners.
