Other notes: Vectors and matrices are in bold (e.g. $x;A$). This is true for vectors in R^n as well as for vectors in general vector spaces. We generally use Greek letters for scalars and capital Roman letters for matrices and random variables. To stay focused at an appropriate level of abstraction, we restrict ourselves to real values. Greek letters Edit. Greek letters are commonly used in mathematics, and they are very easy to type in math mode.You just have to type the name of the letter after a backslash: if the first letter is lowercase, you will get a lowercase Greek letter, if the first letter is uppercase (and only the first letter), then you will get an uppercase letter.

Here, and in (1) too, there is no reason to restrict to real matrices and polynomials. We could equally well have considered matrices with entries drawn from \mathbb{C} or polynomials with complex coefficients. (3) Assume that S is a non-empty subset of R closed under multiplication and such that $S \neq \{0\}$. Then \cdot is a binary operation on $S \setminus \{0\}$.

This is an important idea in the study of sequences (and series). Treating the sequence terms as function evaluations will allow us to do many things with sequences that we couldn't do otherwise. Before delving further into this idea however we need to get a couple more ideas out of the way. First, we want to think about "graphing" a ...
