Stephen R. Turns (Author of An Introduction to Combustion)
Combustion is the burning of some kind of fuel — whether it’s natural gas, propane, oil, coal, or wood — to produce usable heat or energy. This energy, in turn, transfers, at first, to a device like a heat exchanger. The exception would be when the flames and gases of combustion make direct contact with whatever needs to be heated.

Incomplete Combustion: Also called "dirty combustion," incomplete combustion is hydrocarbon oxidation that produces carbon monoxide and/or carbon (soot) in addition to carbon dioxide. An example of incomplete combustion would be burning coal (a fossil fuel), during which quantities of soot and carbon monoxide are released.

Combustion is not necessarily favorable to the maximum degree of oxidation, and it can be temperature-dependent. For example, sulfur trioxide is not produced quantitatively by the combustion of sulfur. NOx species appear in significant amounts above about 2,800 °F (1,540 °C), and more is produced at higher temperatures.
