Its value is backed up to the root, and that evaluation becomes the valuation of the position on the board. This search process is called minimax. A naive implementation of the minimax algorithm can only search to a small depth in a practical amount of time, so various methods have been devised to greatly speed the search for good moves.

This work was a precursor of modern mathematical theorem provers. Of all the exploratory work done during this period, perhaps the most influential in the long run was that of Arthur Samuel on checkers (draughts). Using methods that we now call reinforcement learning (see Chapter 22), Samuel's programs learned to play at a strong amateur level.
