Refraction occurs when light travels from one medium into another (i.e. from air into water). Refraction is the changing of direction of light due to the changing speed of light. Refraction occurs toward the normal when light travels from a medium into a denser

In vector notation, for the normal to the surface \hat{n} , and incident and transmitted waves \hat{k}_i and \hat{k}_t respectively, the law of refraction can be written: $n_i (\hat{k}_i \times \hat{n}) = n_t (\hat{k}_t \times \hat{n})$ Dispersion

Ambient light alters refraction in 2-D material

Or in physics speak, on how much of a difference in optical density there is between the medium it was first traveling in and the object it is entering.

Download Ebook Physics Study Guide Refraction And Lenses Answers

Another word for "optical density" is the index of refraction. The index of refraction, or n , is a measure of how much slower light travels in a medium compared to the speed of light in a vacuum.
